

> **Rossö 2000 Plow / diagonal/truck**

The Rossö 2000 is a diagonal plow equipped with shock-absorbing steel cutting edges with a 75° positive plowing angle. The cutting edges are rubber-mounted to operate more quietly and follow the contours of the road better. Four or five independent rubber elements in the blade-holder make this possible. The plow can also be equipped with holders for rubber cutting edges. The top section of the plow is made of Robalon and can easily be screwed onto or off of the ribs for replacement.

Instead of wheels, the plow can also be equipped with friction plates.

The plow's standard equipment includes a parallelogram for the VV-85/95 with a hydraulic lift and right and left rotation. The parallelogram can be adapted for use with other mounts.

Accessories:

The two larger plows, DP-37/40-KP, can be equipped with a Snowguard.
